

Re-ment is decarbonising cement by using circular waste streams

Cemvision

SPHERE — CONSTRUCTION

Cemvision converts industrial slags into high-performance cement and electrifying the process.

Re-ment is designed to replace conventional cement 1:1, targeting up to 95% lower CO_2 emissions without requiring changes to customers' production processes.

The company also has proprietary technology to valorize modern steel EAF slag into feedstock while recovering valuable critical metals from the steelmaking process.

~80-95%

PLANNED INDUSTRIAL DELIVERIES

PROVEN POTENTIAL

from BELIEF *to* BANKABILITY

Laser focus for a massive climate challenge

Cement accounts for approximately 7 – 8% of global CO_2 emissions. Cemvision is targeting this specific problem with Re-ment. Its opportunity is to replace conventional cement in established construction applications without requiring customers to redesign their production processes or pay a green premium.

PRICE PARITY

EXISTING WORKFLOW

INDUSTRIAL DEMANDS

THE COMMERCIAL THESIS

Cemvision aims to match conventional cement on price while reducing emissions, but cost parity and full-scale margins remain unproven.

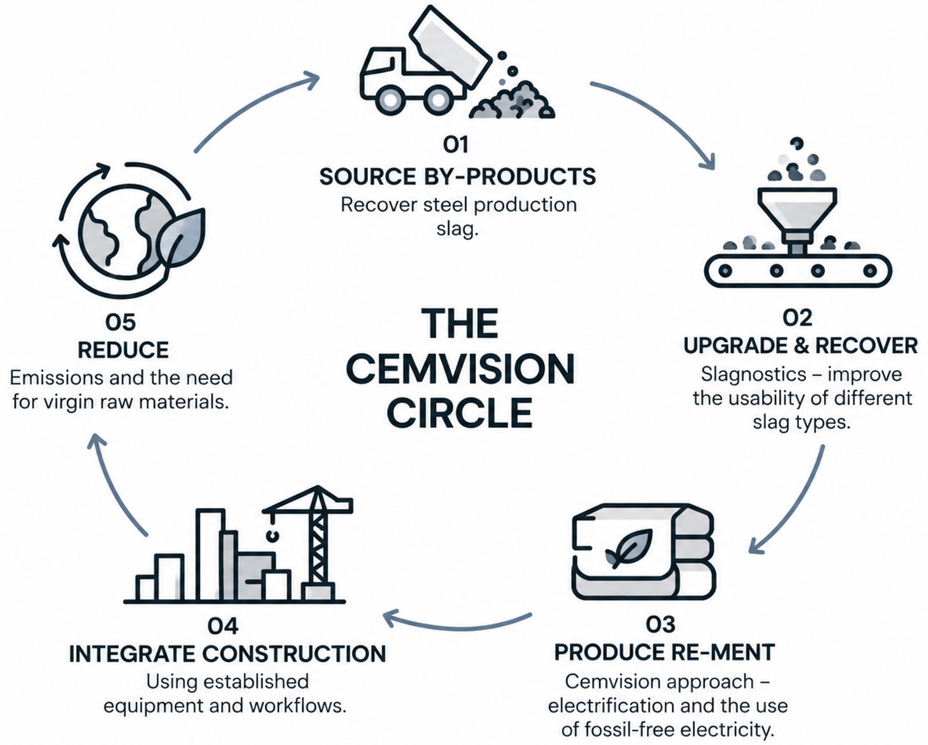

Cemvision

Turning steel slag into cement feedstock and valuable metals

Cemvision creates value across two industrial value chains:

- Construction (concrete) – The near zero cement is made from industrial waste streams (steel slags) while eliminating the need to quarry virgin limestone.
- Steelmaking: Cemvision has developed proprietary technology to upgrade low-grade slag from modern steel manufacturing processes into reactive SCMs (Supplementary Cementitious Materials) while recovering valuable metals that can be returned to industrial use.

By replacing virgin raw materials with industrial by-products, the process aims to reduce emissions, material waste and dependence on newly extracted resources.

Cemvision seeks to create value in two industrial value chains, steel and construction, while reducing cement's climate impact.

Cemvision

Technology development to industrial deployment

Early equity funded technology development. Strategic investors, industrial partnerships and customer commitments helped advance validation and commercialisation, leading to a signed €40 million EIB financing agreement for industrial expansion, and just recently a €27.5 million grant from EU

2020
COMPANY FOUNDED

Cemvision is founded to develop lower-carbon cement technology.

25MSEK

2022
PRE-SEED EQUITY

Early investors support technology development and the progression towards industrial applications.

€10M

2024
SEED ROUND

BackingMinds, Polar Structure and Zacua Ventures participate in a financing round to support further development and scale-up.

2025
INDUSTRIAL VALIDATION AND STRATEGIC PARTNERS

JM joins as an investor and strategic partner. Vattenfall signs a commercial supply agreement in December.

2026
PRODUCT LAUNCH & FINANCING MILESTONE

Linotol launches MaxiFloor Cemvision N7. The European Investment Bank signs €40m.

2028
PLANNED INDUSTRIAL DELIVERIES

Vattenfall agreement is planned.

Cemvision

The magic of no green price premium when market dynamics change

Cemvision combines a focused product strategy with industrial validation and a route to customer adoption. Its potential advantage comes from solving several barriers at once: emissions, material performance, production integration and cost.

01 — FOCUS

Focus creates a clearer route to market

Concentrating on cement allows Cemvision to build its technology, product qualification and partnerships around a defined industry and its requirements.

02 — NO GREEN PREMIUM

Future cost parity as market dynamics change

If Re-ment can match conventional cement on cost while delivering substantially lower emissions, adoption becomes less dependent on customers accepting a higher price. This is a central commercial thesis, not yet a proven full-scale result.

03 — PARTNERS

Partners help bridge the adoption gap

Vattenfall brings a commercial supply relationship, JM combines investment with construction-industry testing, and Linotol demonstrates use in an actual industrial floor. Each helps address a different barrier between innovation and adoption. Tata Steel and Cemvision have partnered to explore converting steelmaking slag into high-value feedstock

04 — CIRCULARITY X TECHNOLOGY

Circularity is part of the technology

Upgrading industrial slag creates an alternative source of cement inputs. The slag beneficiation can enable metal recovery and feedstock flexibility that may improve resilience as steelmaking processes and slag characteristics change.

STRATEGIC PARTNERSHIPS

Combining a focused cement solution with existing construction processes and partnerships with Vattenfall, JM and Linotol.

Cemvision

Connecting technology, customers and capital

Cemvision shows how a focused industrial innovation can progress towards bankability when technical development is combined with customer validation, strategic partners and a financing path.

01 Turn Industrial Waste into Valuable Products

Cemvision upgrades steel slag into lower-carbon cement. Slag beneficitation creates feedstock flexibility while recovering valuable metals back to the steel industry. The opportunity is to create value from materials that would otherwise be treated as waste.

02 Prove the Full Commercial ROI

Product-market fit, 1:1 substitution and compatibility with existing workflows reduce adoption barriers. The investment case depends on demonstrating competitive unit economics across production, installation, handling, and the wider value chain.

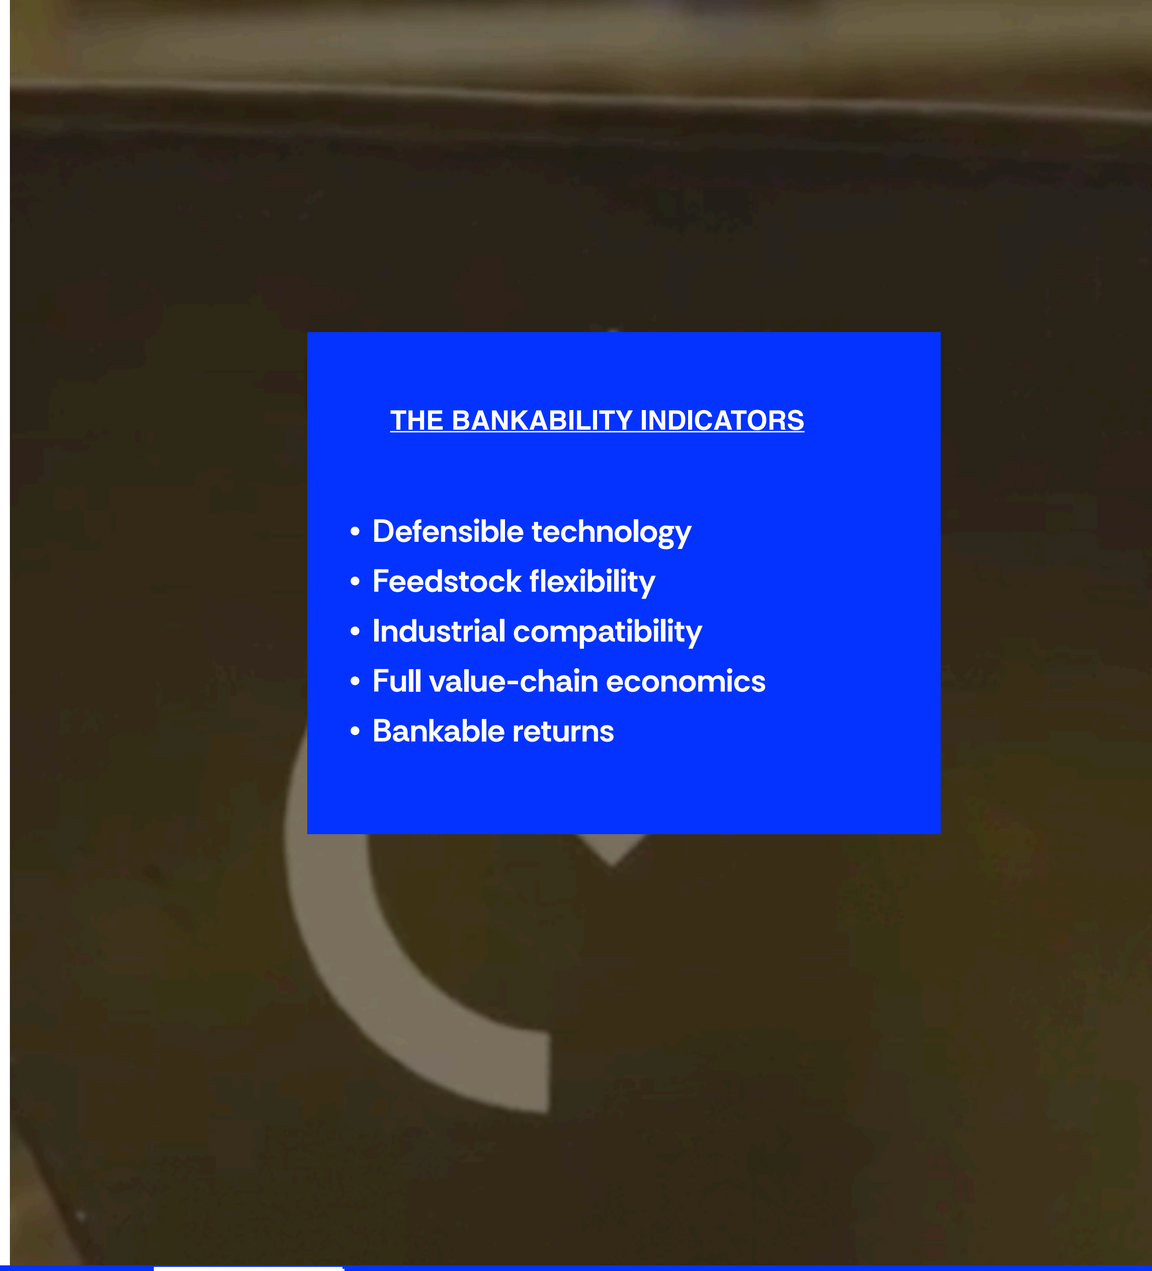

03 Convert Financing into Industrial Scale

Early equity, strategic investors, customer commitments and signed EIB financing have supported the path towards industrial production. Reliable output, operating performance, margins and repayment capacity remain key milestones to prove.

EIB's €40 million financing supports Cemvision's planned industrial-scale production, building on progress in customer partnerships, product validation and commercialisation.

“Build flexibility across feedstocks, and realize large scale production and full value-chain economics”

Johan Wiksell
Investor, JM Ventures

THE BANKABILITY INDICATORS

- Defensible technology
- Feedstock flexibility
- Industrial compatibility
- Full value-chain economics
- Bankable returns

VALUE CHAIN ADVANTAGE

Creating value across the entire value chain while reducing emissions and dependence on virgin raw materials.
